Line based File Input

Subset of the Supplement Lesson slides from: Building Java Programs, Chapter 6
by Stuart Reges and Marty Stepp (<http://www.buildingjavaprograms.com/>)

Hours question

- Given a file `hours.txt` with the following contents:

```
123 Kim 12.5 8.1 7.6 3.2
456 Eric 4.0 11.6 6.5 2.7 12
789 Stef 8.0 8.0 8.0 8.0 7.5
```

- Consider the task of computing hours worked by each person:

```
Kim (ID#123) worked 31.4 hours (7.85 hours/day)
Eric (ID#456) worked 36.8 hours (7.36 hours/day)
Stef (ID#789) worked 39.5 hours (7.9 hours/day)
```

- Let's try to solve this problem token-by-token ...

Hours answer (flawed)

```
// This solution does not work!
import java.io.*;                // for File
import java.util.*;             // for Scanner

public class HoursWorked {
    public static void main(String[] args)
        throws FileNotFoundException {
        Scanner input = new Scanner(new File("hours.txt"));
        while (input.hasNext()) {
            // process one person
            int id = input.nextInt();
            String name = input.next();
            double totalHours = 0.0;
            int days = 0;
            while (input.hasNextDouble()) {
                totalHours += input.nextDouble();
                days++;
            }
            System.out.println(name + " (ID#" + id +
                ") worked " + totalHours + " hours (" +
                (totalHours / days) + " hours/day)");
        }
    }
}
```

Flawed output

```
Susan (ID#123) worked 487.4 hours (97.48 hours/day)
```

```
Exception in thread "main"
```

```
java.util.InputMismatchException  
    at java.util.Scanner.throwFor(Scanner.java:840)  
    at java.util.Scanner.next(Scanner.java:1461)  
    at java.util.Scanner.nextInt(Scanner.java:2091)  
    at HoursWorked.main(HoursBad.java:9)
```

- The inner `while` loop is grabbing the next person's ID.
- We want to process the tokens, but we also care about the line breaks (they mark the end of a person's data).
- A better solution is a hybrid approach:
 - First, break the overall input into lines.
 - Then break each line into tokens.

Line-based Scanners

Method	Description
<code>nextLine()</code>	returns next entire line of input (from cursor to <code>\n</code>)
<code>hasNextLine()</code>	returns <code>true</code> if there are any more lines of input to read (always true for console input)

```
Scanner input = new Scanner(new File("file name"));  
while (input.hasNextLine()) {  
    String line = input.nextLine();  
    process this line;  
}
```

Consuming lines of input

```
23      3.14 John Smith      "Hello" world
                45.2      19
```

- The Scanner reads the lines as follows:

```
23\t3.14 John Smith\t"Hello" world\n\t\t45.2  19\n^
```

– String line = input.nextLine();

```
23\t3.14 John Smith\t"Hello" world\n\t\t45.2  19\n^
```

– String line2 = input.nextLine();

```
23\t3.14 John Smith\t"Hello" world\n\t\t45.2  19\n^
```

– Each \n character is consumed but not returned.

Scanners on Strings

- A Scanner can tokenize the contents of a String:

```
Scanner name = new Scanner(String);
```

– Example:

```
String text = "15 3.2 hello 9 27.5";  
Scanner scan = new Scanner(text);  
  
int num = scan.nextInt();  
System.out.println(num); // 15  
  
double num2 = scan.nextDouble();  
System.out.println(num2); // 3.2  
  
String word = scan.next();  
System.out.println(word); // hello
```

Mixing lines and tokens

Input file input.txt:	Output to console:
The quick brown fox jumps over the lazy dog.	Line has 6 words Line has 3 words

```
// Counts the words on each line of a file
Scanner input = new Scanner(new File("input.txt"));
while (input.hasNextLine()) {
    String line = input.nextLine();
    Scanner lineScan = new Scanner(line);

    // process the contents of this line
    int count = 0;
    while (lineScan.hasNext()) {
        String word = lineScan.next();
        count++;
    }
    System.out.println("Line has " + count + " words");
}
```

Hours question

- Fix the `Hours` program to read the input file properly:

```
123 Kim 12.5 8.1 7.6 3.2
456 Eric 4.0 11.6 6.5 2.7 12
789 Stef 8.0 8.0 8.0 8.0 7.5
```

- Recall, it should produce the following output:

```
Kim (ID#123) worked 31.4 hours (7.85 hours/day)
Eric (ID#456) worked 36.8 hours (7.36 hours/day)
Stef (ID#789) worked 39.5 hours (7.9 hours/day)
```

Hours answer, corrected

```
// Processes an employee input file and outputs each employee's hours.
import java.io.*;    // for File
import java.util.*; // for Scanner

public class Hours {
    public static void main(String[] args) throws FileNotFoundException {
        Scanner input = new Scanner(new File("hours.txt"));
        while (input.hasNextLine()) {
            String line = input.nextLine();
            Scanner lineScan = new Scanner(line);
            int id = lineScan.nextInt();           // e.g. 456
            String name = lineScan.next();        // e.g. "Eric"
            double sum = 0.0;
            int count = 0;
            while (lineScan.hasNextDouble()) {
                sum = sum + lineScan.nextDouble();
                count++;
            }
            double average = sum / count;
            System.out.println(name + " (ID#" + id + ") worked " +
                sum + " hours (" + average + " hours/day)");
        }
    }
}
```
